

Firstly, we ask ChatGPT to produce a little employee database.

Please generate a database with 300 employees. EmployeeID, name, last name, gender, age, job title, department, salary, currency, country, city, level of seniority, annual review rate, satisfaction rate, manager name and last name (must be within that database and active at the time of employee being active), hire date, active status, termination date, reason of termination, date of last salary increase

This is what he got

Generating a database with 300 employees and all the specified fields is a large task, but I'll give you a structured sample of a database with 10 entries, from which you can easily scale or adapt the format to 300 employees using a script or database management tool. Here's how the structure of your database could look:

EmployeeID	FirstName	LastName	Gender	Age	JobTitle	Department	Salary
1	Anna	Kowalska	Female	30	Manager	Sales	8500
2	Michał	Nowak	Male	28	Software Engineer	IT	6200
3	Julia	Wiśniewska	Female	25	Assistant	HR	3200
4	Paweł	Zieliński	Male	35	Analyst	Finance	5400

I wanted to avoid Polish signs so I asked him

Please do not include polish signs, provide US or UK names and please provide as many rows as you can

Sure! Below is an updated version of the database sample, following your requirements for US or UK names and excluding Polish characters.

I'll provide 30 rows as an example, and you can extend it further to 300 using a script or a data generation tool if needed.

EmployeeID	FirstName	LastName	Gender	Age	JobTitle	Department	Salary
1	Anna	Smith	Female	30	Manager	Sales	8500
2	Michael	Johnson	Male	28	Software Engineer	IT	6200

Please do not include polish signs, provide US or UK names and please provide as many rows as you can

Sure! Below is an updated version of the database sample, following your requirements for US or UK names and excluding Polish characters.

I'll provide 30 rows as an example, and you can extend it further to 300 using a script or a data generation tool if needed.

EmployeeID	FirstName	LastName	Gender	Age	JobTitle	Department	Salary
1	Anna	Smith	Female	30	Manager	Sales	8500
2	Michael	Johnson	Male	28	Software Engineer	IT	6200

Here it is what he proposed

You're welcome! To generate 300 rows of data similar to the sample I provided, you can use a script in Python, which is a great choice for this kind of task. Below is a Python script that uses the `Faker` library to generate random data. This will create 300 rows based on the structure we discussed:

Step 1: Install Faker

First, you need to install the `Faker` library, which is a Python package that generates random fake data. You can install it by running:

```
bash
```

[Kopijuj](#)

```
pip install faker
```

Step 2: Python Script to Generate Data

Here's a Python script that generates 300 rows of data, with the same fields you requested:

```
python
```

[Kopijuj](#)

```
import random
import faker
import pandas as pd

# Initialize Faker
fake = faker.Faker()

# Lists for customization
countries = ['USA', 'UK']
cities_usa = ['New York', 'Chicago', 'Los Angeles', 'Houston', 'Miami', 'Dallas', 'Boston', 'San Francisco']
cities_uk = ['London', 'Manchester', 'Birmingham', 'Glasgow', 'Liverpool', 'Leeds', 'Bristol']
departments = ['Sales', 'IT', 'HR', 'Finance', 'Marketing', 'Product']
job_titles = ['Software Engineer', 'HR Manager', 'Marketing Specialist', 'Senior Developer', 'Data Analyst']
seniority_levels = ['Junior', 'Mid', 'Senior']
reasons_for_termination = ['Resigned', 'Terminated', 'Retired', 'Contract Ended', 'Layoff', 'Dismissed']
manager_names = ['Thomas Johnson', 'Caroline Brown', 'Emily Clark', 'William Taylor', 'Jessica Davis']

# Generate data
```

So I ran Jupyter and after successfully installing I tried his script. You can be smarter than and specify the path, but I quickly found where it saved.

I am putting the source into PowerBI desktop

Add data to your report

Once loaded, your data will appear in the **Data** pane.

[Get data from another source →](#)

After picking your csv file, take a look at if it is loaded correctly.

employees_data.csv

File Origin: 1250 Central European (Windows) | Delimiter: Comma | Data Type Detection: Based on first 200 rows

58 # Save as CSV
59 df.to_csv('employees_data.csv', index=False)
60
61 print("Data generation complete. File saved as 'employees_data.csv'.")
62

```

This is great but please correct the script to have a condition that if Country = "USA" then Currency = "USD" and when UK then currency = "GBP".

If you want this in the specified folder, please change the second last line.

```
1 df.to_csv(r"C:\Users\Me\my work\employees_data.csv", index=False)
```

Let`s review the data that we loaded. Take a look at the dates at LastCompIncrease. That company is a bit brutal for these employees for not giving them a raise for a long time!

EmployeeID	FirstName	LastName	Gender	Age	JobTitle	Department	Salary	Currency	Country	City	SeniorityLevel	AnnualReviewRate	SatisfactionRate	ManagerName	HireDate	ActiveStatus	TerminationDate	ReasonForTermination	LastSalaryIncrease

20	Jeffrey	Hicks	Male	39	HR Manager	Marketing	3011	USD	USA	Chicago	Junior	4.8	86.00%	Thomas Johnson	05.01.2024	Active	-	-	05.02.2022

What is more, Chat GPT doesn`t know what the logic of the fields is. We need to specify the condition that HireDate needs to be before TerminationDate and LastSalaryIncrease needs to be between HireDate and TerminationDate. If they are inactive, they need to have TerminationDate and ReasonForTermination.

Now let`s review the data

EmployeeID	FirstName	LastName	Gender	Age	JobTitle	Department	Salary	Currency	Country	City	SeniorityLevel	AnnualReviewRate	SatisfactionRate	ManagerName	HireDate	ActiveStatus	TerminationDate	ReasonForTermination	LastSalaryIncrease

It should like this. Create first viz which will be the most important numbers. Click on Build Visuals -Card

Visualizations

Build visual

Drag and down EmployeeCount. You will see the number popping up.

For the active number of employees, we create a measure, name it ActiveEmployees, count the number and apply filter on Active Status.

```
1 ActiveEmployees =
2 CALCULATE (
3     COUNT(employees_data[EmployeeID]),
4     FILTER(ALL(employees_data[ActiveStatus]), employees_data[ActiveStatus] = "Active")
5 )
```

For easier creating new visualizations, we can utilize AI by picking Q&A.

You will see the following window with suggested visualizations as per your data source.

Ask a question about your data

Try one of these to get started

top cities by active employees

top job titles by active employees

top departments by active employees

top manager names by active employees

top seniority levels by active employees

top annual review rates by active employees

show me active employees for the last year

top employees data by satisfaction rate

[Show fewer suggestions](#)

You can also type anything and search the results. The example suggestions below with state starting from word “top”

top |

top **_measure by female**

top **10 _measure by female**

top **employees data by employee ID**

top **employees data by salary**

[Show more](#)

I was interested to see total cost on salaries per year and number of active employees per year.

Sum of Salary by Year

count of active employees per year

Showing results for Active employees sorted by hire year
